PROFILE

Software Engineering student and full-stack developer building web applications, backend services, and AI-assisted products. Founder of IFAA TECHNOLOGIES, with project work spanning education platforms, MCP tool integration, agent orchestration, and document-based AI workflows. Uses specifications, focused iterations, code review, and testing to connect product ideas with maintainable software.

TECHNICAL SKILLS

Application development: TypeScript, JavaScript, Python, React, Next.js, Node.js, Express, NestJS, Django, REST APIs, Tailwind CSS.

Data and delivery: PostgreSQL, MongoDB, Supabase, Redis, Git/GitHub, Docker, CI/CD workflows, cloud fundamentals, OpenAPI.

AI engineering: Agentic AI, Model Context Protocol (MCP), LangGraph, Gemini integration, prompt/context engineering, structured outputs, document extraction and chunking, keyword retrieval, RAG fundamentals.

Engineering practice: Requirements analysis, spec-driven development, modular design, relational data modeling, authentication/RBAC, input validation, automated testing, accessibility, debugging, technical documentation.

SELECTED PRODUCT WORK

IFAA TECHNOLOGIES | Founder & Developer

https://www.ifaatechnologies.tech

- Built the company website and application codebase using Next.js, TypeScript, Supabase, and Tailwind CSS.
- Connected public product and service pages with protected customer and administrator workflows for projects, inquiries, conversations, and content.
- Applied database access policies, responsive browser checks, accessibility checks, and search metadata to support a clear public presence.

IFAA ENTRANCE | Founder & Developer

https://entrance.ifaatechnologies.tech/en

- Developed an Ethiopian examination preparation product with a multilingual Next.js frontend and a NestJS/PostgreSQL backend.
- Implemented subject practice, timed sessions, progress views, role-based workspaces, offline support, and AI-assisted explanations.
- Used written specifications, contextual prompts, reviewed changes, and regression checks to guide development.

EDUCATION

BSc in Software Engineering | In Progress

Adama Science and Technology University, Ethiopia

Developing foundations in algorithms, data structures, object-oriented programming, software requirements, database design, and the software development lifecycle through study and project practice.

AI & BACKEND ENGINEERING PROJECTS

Selected challenge, academic, and learning projects applying agent orchestration, document context, and backend design.

Project Chimera | Agentic AI Challenge

https://github.com/fahamijemal/Chimera

- Implemented MCP client/tool connections within a planner, worker, and judge architecture. Used specification-led tasks to explore tool-using agent workflows in Python.

Automaton Auditor | AI Evaluation Challenge

https://github.com/fahamijemal/automaton-auditor

- Built a LangGraph workflow combining repository/document evidence, parallel reviewer roles, structured model outputs, and rule-based synthesis. Implemented PDF chunking and keyword-based retrieval.

EduAI Assistant | Applied AI Learning Project

https://github.com/fahamijemal/eduai-assistant

- Developed document-context questions, summaries, comparisons, and quiz generation with Gemini, React, Express, and MongoDB. Applied prompt/context engineering to study-material workflows.

ASTU Smart Complaints API | Academic Project

https://github.com/fahamijemal/astu-smart-complaints-backend

- Built a TypeScript/Express API for complaint tracking with PostgreSQL, Redis, role-based permissions, authentication, notifications, and OpenAPI documentation.

DEVELOPMENT APPROACH

Discover & specify: Clarify users, constraints, functional/non-functional requirements, user stories, and testable acceptance criteria.

Design: Plan modular responsibilities, data models, API contracts, permission boundaries, failure states, and architecture tradeoffs.

Implement: Work in small Git changes; give agents relevant context, bounded tools, and explicit tasks. Review generated code and keep secrets outside prompts.

Verify: Use appropriate unit, integration, and browser checks. Assess accessibility, authorization, AI grounding, structured outputs, and fallback behavior.

Release: Validate configuration, migrations, automated checks, deployed workflows, and rollback options.

Maintain: Use feedback and error/performance signals to prioritize fixes; update documentation and dependencies. Develop retrieval evaluation skills while considering AI quality, latency, and cost.

CONTINUOUS LEARNING

Coursera: JavaScript Full Stack Capstone Project; Python for Data Science and AI; Developing Applications with SQL, Databases, and Django; Git and GitHub Essentials.

AWS Educate: Introduction to Cloud 101 training badge.

Current focus: retrieval-augmented generation evaluation, source attribution, reliable tool-using agents, and backend/cloud engineering.
